

AMENDMENTS TO THE CLAIMS

1-39. (Cancelled)

40. (Currently Amended) A transparent conductive laminate according to claim 20,
comprising:

a film made of a polymer with a photoelastic constant of no greater than $70 \times 10^{-12} \text{Pa}^{-1}$
(polymer film A),

a light-scattering layer with a haze value in the range of 0.2-1.4% formed directly on one
side thereof, and

a transparent conductive layer formed on the other side thereof,

wherein the laminate exhibits a $\lambda/4$ retardation,

wherein an optical interference layer comprising a high refractive index layer and a low
refractive index layer is formed between said polymer film A and said transparent conductive layer
so that said transparent conductive layer is in contact with the low refractive index layer side, the
high refractive index layer and low refractive index layer are both made of crosslinked polymers

wherein a cured resin layer is between said first polymer film and said transparent
conductive layer, and wherein said cured resin layer contains first fine particles having a mean
primary diameter of 0.5-5 μm and second fine particles having a mean primary diameter of no
greater than 100 nm, and

wherein said cured resin has a first fine particle as a content of at least 0.3 part by weight
and less than 1.0 part by weight to 100 parts by weight of a cured resin component.

41. (New) A transparent conductive laminate comprising:
a movable electrode substrate facing a fixed electrode substrate,
said movable electrode substrate including:
a first polymer film between a light-scattering layer and a transparent
conductive layer,
wherein a photoelastic constant of said first polymer film is no greater than
 $70 \times 10^{-12} \text{ Pa}^{-1}$,
wherein a haze value of said light-scattering layer is 0.2 - 1.4%, and
wherein said movable electrode substrate exhibits a $\lambda/4$ retardation, and
said fixed electrode substrate including:
a second polymer film exhibiting a $\lambda/4$ retardation.
42. (New) A transparent conductive laminate according to claim 41, wherein a center line
average roughness (Ra) of said light scattering layer is 0.005-0.04 μm .
43. (New) A transparent conductive laminate according to claim 41, wherein said first
polymer film is a thermoplastic resin with a glass transition temperature (Tg) of 170° C or above.
44. (New) A transparent conductive laminate according to claim 43, wherein said
thermoplastic resin is a polycarbonate.

45. (New) A transparent conductive laminate according to claim 41, wherein said first polymer film is a single layer $\lambda/4$ retardation film.

46. (New) A transparent conductive laminate according to claim 41, wherein said first polymer film is a laminate film having two or more layers, said two or more layers including a single layer $\lambda/4$ retardation film and a single layer $\lambda/2$ retardation film.

47. (New) A transparent conductive laminate according to claim 41, wherein said first polymer film is between a third polymer film and said transparent conductive layer, said third polymer film having a photoelastic constant of no greater than $70 \times 10^{-12} \text{Pa}^{-1}$.

48. (New) A transparent conductive laminate according to claim 47, wherein said first polymer film has a retardation value of no greater than 30 nm, and said third polymer film is a laminated retardation film comprising a single layer $\lambda/4$ retardation film and a single layer $\lambda/2$ retardation film.

49. (New) A transparent conductive laminate according to claim 48, wherein said first polymer film is a single layer $\lambda/4$ retardation film, and said third polymer film is a single layer $\lambda/2$ retardation film.

50. (New) A transparent conductive laminate according to claim 41, wherein a cured resin layer is between said first polymer film and said transparent conductive layer.

51. (New) A transparent conductive laminate according to claim 50, wherein said cured resin layer contains first fine particles and second fine particles.

52. (New) A transparent conductive laminate according to claim 41, wherein an optical interference layer is between said first polymer film and said transparent conductive layer.

53. (New) A transparent conductive laminate according to claim 52, wherein a cured resin layer is between said first polymer film and said optical interference layer.

54. (New) A transparent conductive laminate according to claim 52, wherein said optical interference layer comprises a high refractive index layer and a low refractive index layer, said high and low refractive index layers being crosslinked polymers.

55. (New) A transparent conductive laminate according to claim 54, wherein said transparent conductive layer is in contact with said low refractive index layer.

56. (New) A touch panel comprising:
the transparent conductive laminate according to claim 41,
wherein a first polarizing plate is formed on a side of said light-scattering layer, and
wherein a gap is between said movable electrode substrate and said fixed electrode substrate.

57. (New) A touch panel-equipped liquid crystal display comprising:

the touch panel according to claim 56;

a liquid crystal cell between said touch panel and a second polarizing plate.

58. (New) A touch panel-equipped liquid crystal display according to claim 57, wherein a third polarizing plate is between two retardation films, said liquid crystal cell being between said third polarizing plate and said second polarizing plate.
